

Quiz 2 (part 1) - Computational Physics I

NAME: _____ SCORE:

Date: Friday 17 May 2024 Duration: 45 minutes

Credits: 10 points (5 questions) Type of evaluation: LAB

This quiz is individual and has two parts: Part 1 is closed-book, in-class, and contains short-answer questions. Part 2 is take-home and contains long application problems.

Provide short and concise answers to the following items:

1. (2 points) Numerical differentiation

Explain how the finite-difference methods for calculating derivatives work, and provide the mathematical definition of a second-order approach.

2. (2 points) Numerical integration

Indicate 2 numerical methods used for calculating 1D integrals numerically, and briefly explain how they work.

3. (2 points) Root finding in python

List 2 methods that we can use to find the roots of 1D functions in python, and briefly explain how these python methods work to obtain the roots.

4. **(2 points) Errors in numerical differentiation**

Explain the sources of errors when calculating the divergence of a 2D vector field on the grid. What defines the order of accuracy of the method?

5. **(2 points) Image processing**

Imagine you obtain the following photograph of rice grains, and you are asked to find the edges of the grains. Design and sketch a suitable algorithm workflow to achieve this goal in python.
