

# Introduction to Linux

- It is an operating system based on Unix, which was developed by Ken Thompson and Dennis Ritchie (at AT&T Bell Laboratories) during the 60's/70's
- Unix was highly portable, so it was adopted, copied, and modified by many companies and universities.
- The source code was available, but modification and redistribution were restricted and its commercial version was too expensive.
- Finnish student Linus Torvalds decides to create a new free operating system kernel called Linux.
- Linux released its first version in 1991.

# Advantages of Linux OS

- Linux OS are free and open source.
- You can modify the source code and adapt it to your applications at will.
- Linux provides security (much harder to hack, nearly no viruses).
- They come with an in-built platform to do programming.
- There are two types of desktops: KDE and GNOME.
- You have many options, the most popular ones in physics are:
  - Ubuntu
  - Fedora
  - Linux Mint
  - Scientific Linux

# Basic Linux commands

1. `man` — offline manual, get help about any commands
2. `which` — find out where a command is defined.
3. `<command> --help` — Find help on any command
4. `cd` — Change the current directory (folder)
5. `ls` — List files in a directory
6. `mkdir` — Make/create a new directory
7. `pwd` — Print current directory
8. `cp` — Copy files and directories
9. `rm` — Delete files and directories

# vi/vim editor

vim - file.txt — edit a file

:wq, :x — save the file

:q — quit from a file

:q! — force quit

Inside the editor: i — insert text/commands.

Exit the editor: Esc

**Exercise:** Let's write a C file that prints "Hola mundo."

Note that C programs have to be compiled first.

# Basic Linux commands

10. `cat file.txt` — see contents of file.

11. `head file.txt` — see the first 10 lines of a file

12. `tail file.txt`— see the last 10 lines of a file.

13. `chmod` — change permissions of a file or directory for 3 user groups: user (owner) permission, group permission, and other permission.

14. `diff file1.txt file2.txt`— show differences between two files

15. `file` — show the type of a file

16. `less` — browse the contents of a file, exit with `q`

17. `locate` — find files with names matching a pattern

18. `touch` — Create a new file or update an existing one

# Basic Linux commands

10. `top` — See what is going on, what processes are running, exit with `q`

11. `ping server` — check to see if a server is alive

12. `df` — show free disk space

13. `du` — show disk space usage

14. `uname -a` — information on Linux kernel

15. `uptime` — how long the system has been running

16. `date` — show current date/time
